

WONFLIKI — INNOVATION EVIDENCE

Evidence for Criterion 1 — Global Talent (Digital Technology), Exceptional Promise

Submitted by: Hillary Widanama Adare, Founder & CEO, Wonfliki. This document supports the claim that Hillary can show innovation as founder of a product-led digital technology company (Criterion 1, Exceptional Promise).

1. Company and product overview

Wonfliki is an agri-technology company, founded by Hillary Adare in 2019, that applies drone-based remote sensing, geospatial data (GIS) and predictive analytics to precision agriculture for smallholder farmers. The company's core innovation is combining computer vision and machine learning with agronomic and financial data to make farm-level decisions actionable for users who would not otherwise have access to this kind of analysis.

2. Core services and technical stack

Wonfliki's core service lines are:

- Mapping — geospatial mapping of farmland for planning and monitoring.
- Crop monitoring via satellite and remote sensing — including NDVI vegetation health analysis, soil moisture estimation, yield prediction and pest risk analysis.
- Drone spraying — precision application services delivered by drone.
- Bespoke services — including site suitability analysis using remote sensing and GIS.

On the technical side: the platform is built on open-source satellite and geospatial datasets rather than proprietary paid data feeds. Computer vision and object detection tasks use YOLO (Ultralytics). The product does not currently integrate IoT sensors — all monitoring is derived from satellite and drone-based remote sensing.

[TO ADD — 2–4 real examples of outputs from actual projects — e.g. a site suitability map, an NDVI crop-health map, or a before/after drone-spraying record. Since the Wonfliki website functions more as an informational digital noticeboard than an interactive live dashboard, project output examples will carry more evidential weight here than website screenshots]

3. Financial inclusion component

Wonfliki partnered on the development of a digital credit-scoring system for smallholder farmers under the LINC programme (US Department of State / IREX), using alternative agricultural data to assess creditworthiness for farmers who typically lack conventional credit histories.

[TO ADD — any detail on how the credit-scoring model works technically, and who deploys it (e.g. named partner financial institutions, if this can be disclosed)]

4. Evidence of traction and innovation recognition

- Absa–Mastercard Foundation grant of \$25,000 (2023) awarded to Wonfliki, supporting product development and market expansion.
- Service coverage expanded to over 15,000 acres of smallholder farmland in Ghana through new client acquisition.
- Delivery of precision agriculture interventions in partnership with financial institutions, farmer groups and agri-value-chain actors.

[TO ADD — the actual Absa–Mastercard award confirmation, inserted here or attached as its own separate evidence document (it cannot be reused as both a standalone document and part of this one)]

[TO ADD — any numbers Hillary can confirm: number of farmers or users actively on the platform, number of paying clients, revenue if any, team size, or year-on-year growth — these are the strongest possible additions to this section]

5. Why this reflects innovation, not just operation

The distinguishing factor Tech Nation looks for under this criterion is evidence of innovation, not simply running an existing business model. The relevant points here are: building a proprietary AI/ML pipeline from remote-sensing data (not licensing an off-the-shelf tool), applying it to a market segment — smallholder farmers — that mainstream agri-tech products typically do not serve, and extending the same data infrastructure into an adjacent innovation (alternative credit scoring) rather than staying single-purpose.

[TO ADD — if available: any comparison to what existing tools in the market do NOT do, to sharpen the innovation claim — e.g. most commercial precision-ag tools are built for large commercial farms, not smallholders]
